FE 630 HWI Utility function 2. 1. Log " Otility. (a) In CCE) = \(\frac{1}{2}\ln(1/50) + \frac{1}{2}\ln(850) =ln(1150x850)=ln(988.69) => CE: 788,69 E(W) = = x/150 + = x850 = 1000 => Risk Premium = 1000 - 988,69= 11,31 Taylor serious exponsions y===== ARA(WT)·Ox, ARA (X) = + = x x /000 x (50) = 11.25 The approximation is quite close to the real value (b) initial wealth = 2000 In (CE) = = = (18to) + = In(18to) - M(1994.3/) => (E=1894.3f =7 RISK Premium = ELW) = CT = 5.63 (C) ln(CE) = \$ln(/300) + \$ln()00) = ln(953.94) >> ct= ft),54. RISK Prenium = EIW) - CE =/000 - 95354

= 46.06

2. 2. CE and RP for a Power Utility

1) ARA =
$$-\frac{U''(LW)}{U'(LW)}$$

= $-\frac{K(K-1)W^{(K-2)}}{KW^{(K-1)}} = -\frac{K^{-1}}{W} = \frac{1-K}{W}$

1) INVESTOR is risk-taker if ARACO (=) K>1

D INVESTOR is risk-ANDERSE if ARA>O (=) K=1

U(1/250) = $25\sqrt{2}$ W* = $E(W) = \frac{3/00}{3} \approx (-33.3)$
 $U(1/250) = 25\sqrt{2}$ U(600) = $\sqrt{016}$
 $U(1/250) = 25\sqrt{2}$ \(\frac{1}{2} + \sqrt{016}\times\frac{1}{3} \times \frac{1}{2} \times\frac{1}{2} \times\frac{1}{

Risk Premium = 1033.33 - 1077.81 = -44.48 y= \frac{1}{2} \cdot ARALW*) \cdot \sigma = -45.96

2. Texponential Utility

(a)
$$ARA = -\frac{U''(rp)}{U'(rp)}$$
 $U(rp) = -e^{-\lambda rp}$
 $u'(rp) = \lambda e^{-\lambda rp}$
 $ARA = -\frac{u''(rp)}{u'(rp)} = \lambda \infty$
 $= \lambda e^{-\lambda rp}$
 $ARA = -\frac{u''(rp)}{u'(rp)} = \lambda \infty$
 $= \lambda e^{-\lambda rp}$
 $= \lambda e^{-\lambda rp}$

because λ is a constant, and r follows Normal Distribution So maximize $E[U(r_{p},w)]$ equals to minimized $\geq .\sigma^{2} = \geq .w^{2} \geq w$ 2021/9/26 上午11:42 FE630 HW1
